

AI in Web Dev

Parinya Damsuwan

Which/how many AI(s) did you use to convert the image to code?

I used 3 AI tools. First, I used **ChatGPT** because I have ChatGPT Pro. Then I tried **Claude** to compare the results and see which AI generated better. Finally, I used the **AI Chat in VS Code** to help edit and refine the code.

What prompts did you use to tweak the code?

I started with a simple prompt:

"Convert this image into HTML and CSS. Split the code into an index.html file and a style.css file."

After seeing the first result, I asked the AI to make the layout more responsive and fit the entire page. However, every time it regenerated the code, it changed parts of the design that I wanted to keep. I found that Claude did a better job resizing the layout, but I ended up using **ChatGPT** and the **VS Code AI Chat** to make the final edits and adjustments.

What percentage of the code did you fix/update by hand?

I manually updated about **5%** of the code. Most of my changes involved adjusting the layout, spacing, and image sizing to better match the original design.

In your opinion, was it worth using AI as a first step?

Absolutely. I think using AI as a first step was very helpful. It gave me a good starting point and helped me understand the assignment more clearly. Instead of starting from scratch, I could focus on improving the design, making it responsive, and refining the final result. AI saved me a lot of time, but I still needed to review, test, and adjust the code myself to make sure it worked properly and matched the original design.
